Взамен
ГОСТ 3295—46

Постановлением Государственного комитета стандартов Совета Министров СССР от 18 октября 1973 г. № 2331 срок действия установлен

с 01.01. 1975 г.
до 01.01. 1980 г.

1. Настоящий стандарт устанавливает числовые значения барометрического и избыточного давлений воздуха на равных уровнях для различных высот, исходя из принятых констант состояния атмосферы на уровне моря и законов изменения давления, установленных ГОСТ 4401—73.

2. Стандарт предназначен для градуировки и поверки приборов типа «высотомер» в заводских и полевых условиях, а также для проведения с минимальным количеством вычислений работ, необходимых при градуировке и поверке приборов.

3. В стандарте приведены зависимости:

барометрического и избыточного давлений и температуры воздуха от геопотенциальной высоты в интервале высот от минус 2000 до плюс 50000 м (табл. 1);

барометрического давления в миллибарах (10^2 Па) от геопотенциальной высоты в интервале высот от минус 1000 до плюс 4600 м через 1 м (табл. 2);

барометрического давления в мм рт. ст. от геопотенциальной высоты в интервале высот от минус 1000 до плюс 4600 м через 1 м (табл. 3);

геопотенциальной высоты от барометрического давления в интервале давлений от 5 до 1000 мбар через 1 мбар (табл. 4);

геопотенциальной высоты от барометрического давления в интервале давлений от 4 до 760 мм рт. ст. через 1 мм рт. ст. (табл. 5);

геопотенциальной высоты от барометрического давления в интервале давлений от 600 до 1200 мбар через 0,1 мбар (табл. 6);

геопотенциальной высоты от барометрического давления в интервале давлений от 450 до 900 мм рт. ст. через 0,1 мм рт. ст. (табл. 7).

4. В приложении к настоящему стандарту приведены расчетные формулы, полученные из уравнений (12) и (13) приложения 1 к ГОСТ 4401—73.

РАСЧЕТНЫЕ ФОРМУЛЫ

1. Табличные значения параметров рассчитаны по формулам, полученным для каждого характерного слоя атмосферы из общих уравнений давления, приведенных в ГОСТ 4401—73, разд. 7 приложение 1.

1.1. Расчетные формулы для геопотенциальных высот от минус 2000 до 11000 м

1.1.1. Давление p выражено в мм рт. ст., геопотенциальная высота H — в метрах:

$$p = (3,53275 - 0,000079691 \cdot H)^{5,255880};$$

$$H = \frac{3,53275 - p^{0,19026310}}{0,000079691}.$$

1.1.2. Давление p выражено в миллибарах, геопотенциальная высота H — в метрах:

Переход от давления при температуре ртути в барометре, равной 0°C, к давлению при любой другой температуре при коэффициенте расширения ртути $\beta = 0,000181456$ осуществляется по формуле

$$P_t = P_{t=0} \cdot (1 + 0,000181456 \cdot t).$$
